SDH

- the right choice !!

Thyregod SDH 800

Thyregod has during many years developed professional machines for the agricultural sector. SDH (Straw Distribution Harrow) is the newest addition. SDH enables an efficient and affordable distribution of the straw, which today can be a challenge with the ever growing combine headers.

SDH is simultaneously an effective tool for the creation of a false seedbed, but with attached seeding equipment, also very effective for establishing cover crops.

Strong Construction

SDH is built around a sturdy frame that provides good stability and an extremely strong and flexible harrow. Nylon bushings mounted between the main frame and cross members, which minimizes noise through the harrow, even at high speeds.

Heavy tines

SDH is equipped with strong dual 16mm tines, which ensures a uniform and even distribution of straw. The teeth are mounted "loose" on the frame, providing a free movable tooth. 75cm long tines ensures plenty of clearance and longevity.

Quick adjustment

The working angle of the teeth, is easily adjusted via the hydraulic piston, which changes the angle of all tines simultaneously. If a different angle on a single tinerow are needed, this can be done by simply moving a rivot. The rail-system ensures that all rows will return to horizontal during transport.

Seeding equipment

SDH can be equipped with a seeding unit. Ladder and railings on the platform increases safety. The seeds are placed in front of the harrow.

Specifications	SDH 800
Working width	8 m
Foldable	Hydraulic
Transport width	2,55 m
Seeding equipment	Optional
Working speeds	+20 km/h
Weight	1.820 kg
